Australian road freight estimates: 2014 update

At a glance

This Information Sheet presents estimates of the road freight task in Australia between 1971–72 and 2012–13. Estimates are available by state for interstate, intrastate and capital city road freight.

Of the states with total freight throughput greater than 10 billion tonne-kilometres (tkm) in 2012–13, Western Australia had the highest total freight growth rate at 4 per cent between 2011–12 and 2012–13. South Australia was second at 2.38 per cent, while New South Wales, Queensland and Victoria had growth rates of below 2 per cent.

In the period from 1971–72 to 2012–13 the total road freight estimate for Australia increased from 27.0 billion tkm in 1971–72 to 204.9 billion tkm in 2012–13.

Western Australia continues to have the highest historical growth rate for total interstate road freight averaging at 7.5 per cent per annum from 1971–72 to 2012–13.

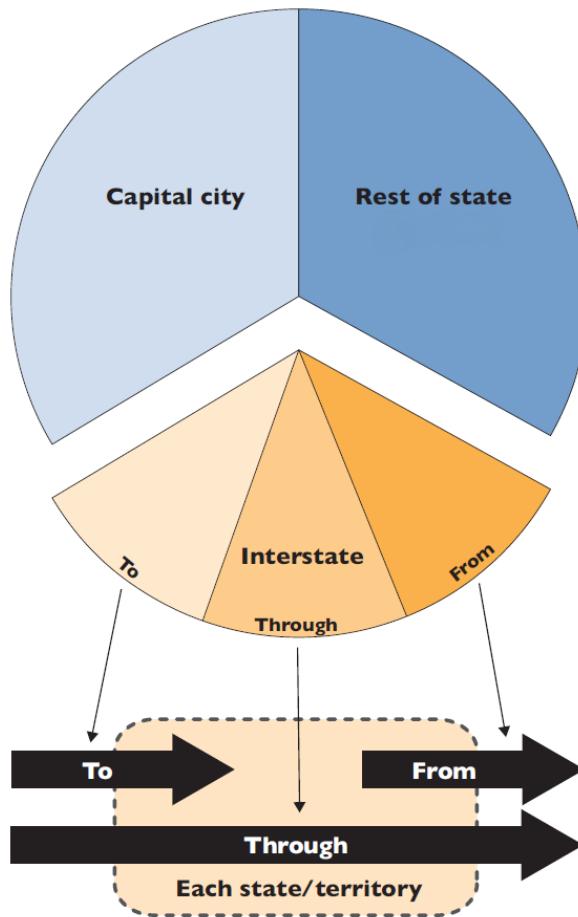

Brisbane maintains the highest historical growth rate for capital city road freight at 6.6 per cent per annum from 1971–72 to 2012–13.

I. Introduction

BITRE (2010) presents a methodology for estimating the road freight task in Australia in each state and territory.

The current analysis uses this methodology to update the values presented in BITRE (2010) to reflect new data from the 2012 issue of the Australian Bureau of Statistics' Survey of Motor Vehicle Use (ABS 2013). Updated estimates are presented for the road freight task for each state, territory and capital city between financial years 1971–72 and 2012–13. Figure I is a schematic representation of the estimates made for each state and territory.

Figure 1: Schematic diagram showing components of road freight estimates in a given state/territory

Source: Modified from figure F2.1 in BITRE (2010).

2. Methodology

A key data source for the update of road freight estimates is the ABS Survey of Motor Vehicle Use (SMVU). SMVU data are available for those years when the survey was conducted. From 1971 to 1995, the survey (SMVU) was conducted every three to five years. From 1998 to 2007 it was conducted annually. It was not conducted in 2008 and 2009 but since 2010 it is conducted every two years.

The analysis starts with the derivation of Australia-level aggregates for each of the SMVU years. However, there is no overlap between the samples selected in consecutive years since the survey has not been specifically designed to measure the change between years. The ABS warns that 'Caution must be used when using the SMVU to measure change'. To derive SMVU-based time series estimates of road freight BITRE has developed methods for adjusting the raw SMVU data:

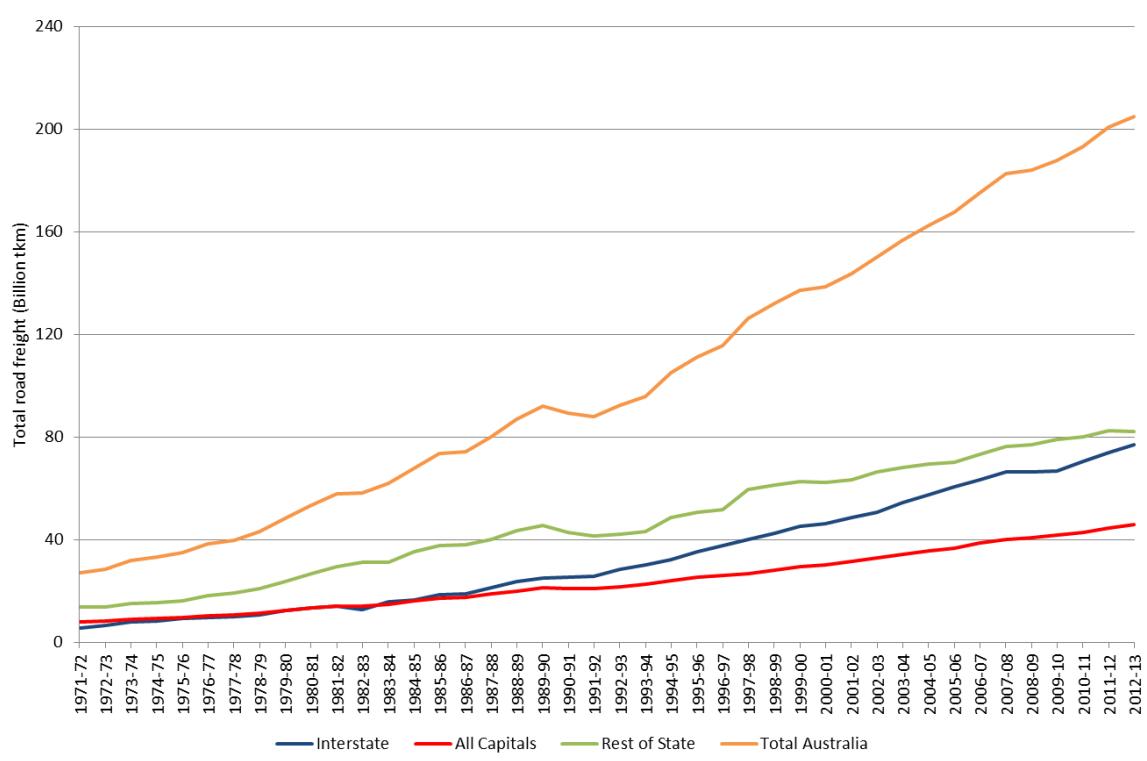

- To improve consistency in estimates over time;
- To adjust for vehicle stock numbers. For example, the interstate road freight task is defined by ABS as the amount of tonne-kilometres done by other States' trucks on a State's roads. But this definition is limited to 'freight carried by trucks registered in other states on a state's roads'. Adjustment is required before road freight in a given state can be derived;
- To correct for the overstating of vehicle kilometres travelled in recall surveys before 1998; and
- To correct the proportion of laden vehicles (especially in 1998 and 1999).

The development of these methods has been reported elsewhere (see Gargett, Hossain & Cosgrove (2006) Soames, Hossain & Gargett (2007), Gargett and Hossain (2008), and BITRE (2006, 2010)).

3. Total road freight estimates for Australia by state/ territory

Figure 2.1 shows the growth in Australia's total road freight split into interstate, capital city and rest of state (intrastate minus capital city). The global financial crisis dampened road freight growth only slightly and for a short time. Total road freight growth only deviated from the trend in the year 2008-09, when only Western Australia and Northern Territory experiencing more than 1% growth in total road freight. Interstate road freight growth was dampened between 2008-09 and 2009-10, but reverted to a pre-crisis growth rate in the following years. This has also caused the estimates reported to be lower than the forecasts reported in the recent Freightline I report (BITRE 2014), which were based on SMVU data from 2007 and earlier.

Figure 2.1 Road freight estimates by interstate, capital cities and rest of state, Australia, 1971-72 to 2012-13

Source: BITRE estimates.

Table 2.1 presents the Australian national total freight. In the period from 1971–72 to 2012–13 the total road freight estimate for Australia increased from 26.98 billion tkm in 1971-72 to 204.87 billion tkm in 2012-13 (Figure 2.1 and Table 2.1). Each of the three components that make up the total also increased as follows:

- Australia's total interstate freight estimate increased from 5.38 billion tkm to 76.84 billion tkm;
- the total road freight estimate in the eight capital cities increased from 7.77 billion tkm to 45.96 billion tkm; and
- the rest of state (i.e. within the state) road freight estimate increased from 13.82 billion tkm to 82.07 billion tkm.

Tables 2.2 to 2.9 show the total interstate, capital city, and rest of state freight by state/ territory from 1971–72 to 2012–13.

Table 2.10 presents the average annual growth rates for the road freight estimates (1972-2012) and forecast for 2013 of interstate ('from', 'to', 'through', and 'total'), 'capital city', 'rest of state' and 'total state' (i.e. sum of interstate, capital city and rest of state) for each state and territory.
